SENIOR SOFTWARE ENGINEER

Senior IC and player-coach who sits at the intersection of product and platform engineering, equally comfortable shaping user-facing experiences and the foundational systems that power them. Brings expertise in building high-reliability B2B SaaS products and the technical leadership to raise the bar across engineering teams.

SKILLS

Languages: Java, Kotlin, TypeScript, SQL, Python

Backend / Platform: Spring Boot, Kafka, Express, Event-driven Systems, REST, GraphQL, Serverless (Azure Functions)

Frontend: React, Next.js, Micro-frontends, Accessibility, Playwright, Vite, React Testing Library, Design Systems (MUI)

Data / Storage: PostgreSQL, Redis, Elasticsearch, CosmosDB, Azure Blob Storage, Apache Iceberg

Infra / Delivery / Observability: Docker, Kubernetes, Terraform, ArgoCD, CI/CD, Datadog, Feature Flags, GitHub Copilot

Security / IAM: OAuth2, SAML, SCIM, Azure B2C, Prisma Cloud

PROFESSIONAL EXPERIENCE

Senior Software Engineer | Versana (Industry-backed FinTech, \$26M raised, B2B SaaS)

April 2023 - Present

Joined as one of the first four engineers and helped scale the team to 25+, while building the core platform to cover \$2.7T in corporate loan commitments across 10+ major financial institutions (Bank of America, Citi, J.P. Morgan, and others).

- Designed event-driven microservices processing 25K+ real-time transaction events from 10+ financial institutions, maintaining 99.5% availability through end-to-end observability (monitoring, tracing, SLO alerting).
- Built Versana's React design system (~50 custom components) and shipped portfolio/integration dashboards (AgGrid/D3) used daily by institutional users, improving developer velocity and CI performance by ~30% while serving ~3K daily requests.
- Owned the core data model (PostgreSQL), designing for scale and auditability to sustain high-volume workloads and low-latency performance under ~500K daily writes and burst spikes exceeding 10x baseline write volume.
- Architected the core data validation framework (JSON Schema-based), directly improving data reliability for 10+ institutional clients and reducing client-driven production issues by 75%.
- Led the delivery of core features that expanded platform data coverage to ~50% of total market transaction volume, enabling new client onboarding and establishing Versana as the unified data standard for the market.
- Delivered a vendor-agnostic feature flag SDK (Java, React) aligned with the OpenFeature spec, enabling product teams to ship faster through gradual rollouts and experiment safely across 100% of apps, while reducing integration effort for engineers by ~80%.
- Co-led migration from a monolithic SPA to a micro-frontend architecture, enabling independent deployments, clearer ownership boundaries, and reducing release coordination across 7 product teams.
- Served as an engineering leader for 25+ engineers, driving engineering standards across software quality, architecture, observability, delivery, and operationalizing AI tooling to improve development velocity by 15%.

Senior Software Engineer | Louisa (Spinout, B2B SaaS) | Goldman Sachs

October 2021 - April 2023

- Partnered with designers and user researchers to identify friction in the core user journey, then led engineering pods to ship features that addressed those gaps, growing the active user base to 40K+ and lifting engagement by 5%.
- Implemented the IAM platform (OAuth2/SAML) that unblocked client onboarding by enabling SSO integration.

Software Engineer | Relationship Analytics and Eng. | Goldman Sachs

July 2019 - October 2021

- Built the central knowledge graph (1M+ nodes, 1B+ edges) powering compliance surveillance tools and surfacing relationship insights used by risk/legal teams firm-wide, serving 10M+ daily API requests to downstream clients.

EDUCATION

B.S. in Computer Science | California State University, Long Beach
